WHAT IS CLAIMED IS:

1. A wrench, comprising a wrench body having an end formed with a drive portion formed with a receiving portion, a ratchet wheel mounted in the receiving portion of the drive portion and having a periphery formed with a plurality of oblique concave portions, and a plurality of rollers each movably mounted in a respective one of the oblique concave portions of the ratchet wheel and each urged on a wall of the receiving portion of the drive portion, wherein:

an included angle is defined between a bottom face of each of the oblique concave portions of the ratchet wheel and a horizontal line of the drive portion of the wrench body.

2. The wrench in accordance with claim 1, wherein the included angle is ranged from 5 and 30 degrees.

3. The wrench in accordance with claim 1, wherein the horizontal line of the drive portion of the wrench body passes through a center of the drive portion of the wrench body.

4. The wrench in accordance with claim 1, wherein the wrench has a resultant driving force passing through the ratchet wheel.

5. The wrench in accordance with claim 1, wherein the wrench has a resultant driving force passing through the bottom face of one of the oblique concave portions of the ratchet wheel.
